

Mohawk Machine Works, LLC introduces its line of surface cleaning and drying equipment for Motorsports, Construction, Seal Coating, Military, and Athletic Field applications....

Designed specifically for quickly removing all standing water and loose debris from any outdoor surface.

Amsterdam, NY USA (June 24, 2013) – Mohawk Machine Works is proud to introduce its new line of outdoor surface cleaning and drying equipment for race facilities, highways, parking lots, airfields, and athletic fields around the world. Mohawk's Patent Pending technology has been tested and proven on some of the premier tracks of NASCAR™ and NHRA™. The innovative technology assisted in track drying operations prior to the start of the NASCAR™ All Star Race on May 18, 2013 at the Charlotte Motor Speedway.

Developed as a more efficient and effective alternative to current methods, the Mohawk design aids in the track drying process by directing an extremely high velocity stream of air onto the racing surface, instantly removing all standing water and loose debris. The combination of pressure, temperature, and velocity greatly increase the evaporation process. The compact design allows for drying and/or debris removal operations to occur under cautions, working in unison with existing track drying equipment.

For commercial seal coating and paint striping operations, productivity is improved over current preparation methods by cleaning and drying in one operation, across an entire lane. Downtime while waiting for surfaces to dry is greatly decreased, increasing the number of jobs which can be bid in a season.

For winter property maintenance operations, the units can quickly and easily remove light snow, and the remnants left behind by snow blowers, creating a safer condition for pedestrians, and saving the environment by greatly reducing the amount of ice melt products required to keep sidewalks and walkways clear. Most large office complexes and campuses likely already have the vehicles necessary to quickly add the systems to their fleets.

Athletic facilities will also benefit from the system's ability to remove standing water and light snow from grass and synthetic playing surfaces, without contacting or damaging the turf.

Mohawk's power units are compact, yet power dense, designed to operate maintenance free all day long on unleaded regular gasoline.

Mohawk's equipment is available in working widths up to 144 inches, with simplistic mounting features designed work with a wide range of customers

existing vehicles, from UTVs, skid steers, and tractors, to commercial mowers, and pickup trucks.
